STAY SHARP

There's no such thing as a one-size-fits-all insulin pen needle, so it's important to shop around to determine which one is best for you. Focus on the needle's length and thickness, its two most important features. Needles range from 4 to 12.7 millimeters long. Short needles tend to work for most people, but your health care provider can help you decide the best length for you.

As for the thickness of a needle—known as its gauge—here's what you need to know: The higher the gauge, the thinner the needle. While thinner needles are less painful during injection, thicker ones can deliver a dose more quickly. Your diabetes educator can recommend other features—such as needles that click onto a device—and help you troubleshoot issues, such as painful injections. Speaking of which: Be sure to change your needle at least daily. Needles used more than once can begin to dull, and dull needles make for more painful injections.
